

CP5046 – Assessment 1 – Due Week 3

DESCRIPTION

Your task is to initiate your own personal “ICT Project Living Document.” A [living document](#) is a written report that gets edited and updated over time. A living document typically serves an evolving purpose, but right now, use it to explore and understand software development. Moreover, this task will allow you to track your learning journey that begins in CP5046 and continues in CP5047! We suggest that you create your living document using **Google docs** or **Microsoft Teams**. Please *provide a link* to it when you submit your work for this assessment task.

Software engineering is the driving force behind software development. Software engineering helps project teams create software that solves real-world problems digitally. Over the past 50 years, software engineering emerged as a comprehensive set of procedures, processes, and practices. Moreover, it’s highly likely that software engineering will continue to change and evolve in the next 50 years.

Some might say that software engineering is an assortment of concepts that are hard to comprehend in significant detail within a short period of time. So, in CP5046 you explore specific aspects of software engineering useful and comprehensible to you right now as a “novice” software developer and “novice” project manager.

Over the next few weeks, your task is to explore some important principles and practices about software engineering, as well as some principles and practices that are specific to the “Extreme Programming” (XP) software development process. That’s because XP is the approach student teams will use to complete the project work in CP5046.

Over the next few weeks, the specific activities you have are:

Week 1: understand and appreciate the scope of “software engineering”.

Week 2: understand the details about “software processes” and why they are important.

Week 3: understand and appreciate “software prototyping” and interviewing techniques.

Please note: the initial learning experiences about software engineering you have while working on this living document over the next few weeks will be especially useful when it comes to working on the self-reflection report (Assessment Task 4).

We expect your “ICT Project Living Document” to contain:

1. An appropriate title page, with your **name** and a **version history** for this document.
2. A section (250-500 words) that **summarises** your existing **coding skills** and **communication skills** – stating your **perceived** level of **competency** of these skills.
3. A section (500-1000 words) that **answers** the weekly discussion questions from Weeks 1-3 – this represents what you currently understand about software engineering.

4. A section where you can reflect on your experience learning about software engineering so far during CP5046.

Note: in CP5046, we introduce software development and project management to students via our flipped learning materials from Week 1 -3 during the trimester. Moreover, we continue exploring these topics during weekly class discussions and workshops throughout the trimester. Hence, we encourage you to maintain and update your ICT Project Living Document beyond its initial due date!

ASSESSMENT ITEM 1: RUBRIC

Criteria	Excellent 90-100%	Good 70-80%	Satisfactory 50-60%	Limited 20-40%	Very Limited 0-10%
Content Quality 25 marks	Comprehensive coverage of all topics with in-depth analysis. All discussion questions are answered with exceptional understanding and insights into software engineering principles, especially those related to "Extreme Programming."	Exhibits aspects of exemplary (left) and satisfactory (right)	Adequate coverage of essential topics. Discussion questions are answered, showing a basic understanding of software engineering. Some areas lack depth or detail.	Exhibits aspects of satisfactory (left) and very limited (right)	Very limited or no coverage of essential topics. Discussion questions are unanswered or show a misunderstanding of software engineering principles.
Reflection and Understanding 25marks	Provides insightful reflections on personal learning and experiences with software engineering. Demonstrates a deep understanding of how the principles apply to real-world scenarios and personal growth as a developer and project manager.		Reflections demonstrate some understanding of the learning process and software engineering principles. Connections to real-world applications and personal growth are made but lack depth.		Reflections are missing or irrelevant. Shows no understanding of software engineering principles or their application.
Organization and Clarity 20 marks	The document is exceptionally well-organized with a clear title page, version history, and distinct sections as required. The narrative is coherent and logically structured, making it easy to follow.		The document meets basic organizational requirements but may lack some elements or clarity in its structure. The narrative is generally easy to follow but occasionally disjointed.		The document is chaotic, with no discernible organization. The narrative is incoherent, making it very difficult to understand the intended message.
Documentation and Evolution 30 marks	The document includes a detailed title page, comprehensive version history, and evidence of substantial updates and revisions that reflect the ongoing learning journey. Demonstrates proactive engagement with the document's evolution.		The document includes a title page and some form of version history. There are some updates, but they are sporadic or superficial, showing limited engagement with its evolution.		The document shows no evidence of updates or revisions, indicating no engagement with its evolution. Missing title page and version history.
